### Abstract

Lately I've been thinking of Space transit, Mars and orbital Habitats. In addition to life support, food, oxygen and water, there will be the socializations as the result of civilian populations. Mundane activities such as culture, hobbies and diversions, commerce, governing, and coupling. The concern I have is little thought is being devoted to what is appropriate for permanent habitation, in any setting other than sustaining life and space activities. I have this suspicion that we are broadly being remiss, in the preparation for new world development and will probably unquestionably install established customs on space, whether they appropriate or not, because there is no effort to install anything. Space is hard enough already and adding complexity by blithe omission is not a strategy. I posit everything finding its way into a habitat discussion, even benign issues of implementing hygiene should be called out, examined for expectations first and most reinvented to maximize interoperability and not inhibit emergency operations. Space culture should be developed to be resilient and around multiple, concurrent shared commons. Commons like technical, communication, legal and governance to start. We should also start testing alternatives and see how they play out, this is more than Space culture should also have an element of modularity, a synthetic culture can be overlaid over a universal commons.

### A short bio
